Patent No. 6753314
GENERAL INFORMATION:
APPLICANT: Giot, Loic
APPLICANT: Mansfield, Traci A.
TITLE OF INVENTION: Protein-Protein Complexes and Method of Using Same
FILE REFERENCE: 18966-542
CURRENT PILING DATE: 2000-03-29
CURRENT APPLICATION NUMBER: 60/127,352
PRIOR PILING DATE: 1990-04-01

Patent No. 6747137

Patent No. 6747137

GENERAL INFORMATION:

APPLICANT: Keith Weinstock et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/248,796A

CURRENT FILING DATE: 1999-02-13

PRIOR PELLING DATE: 1999-02-13

PRIOR PELLING DATE: 1999-02-13

PRIOR FILING DATE: 1999-08-13

NUMBER OF SEQ ID NOS: 28208

SEQ ID NO 24375

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

Publication No. US20050031633A1

GENERAL INPORMATION:

APPLICANT: Smith, Daniel J.

APPLICANT: Taubman, Martin A.

TITLE OF INVENTION: Glucan Binding Protein and Glycosyltransferase Immunogens

TITLE OF INVENTION OF 100797, 821

CURRENT APPLICATION NUMBER: US/10/797, 821

CURRENT FILING DATE: 2004-03-09

PRIOR APPLICATION NUMBER: 60/363, 209

PRIOR APPLICATION NUMBER: 60/363, 209

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 6, Application US/09740274
Patent No. US20020031826A1
Patent No. US20020031826A1
APPLICANT: Nichols. Scott E.
TITLE OF INVENTION: Glucan-containing Compositions and Paper
FILE REFERENCE: 0357CMD
CURRENT APPLICATION UNMER: US/09/740,274
CURRENT FILING DATE: 2000-12-19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match 53.8%; Score 57; DB 5; Length 1497; Best Local Similarity 52.9%; Pred. No. 7.2; Matches 9; Conservative 3; Mismatches 5; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FEATURE:
NAME/KEY: MOD_RES

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence Sequence Sequence 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence Sequence 3

(FORS-) FORSYTH DENTAL INFIRMARY FOR CHILDREN raubman MA, Smith DJ;

92US-00877295

01-MAY-1992;

WPI; 1993-368721/46.

The sequences (AAR41694-98) are subsequences from GT, they provoke T- and B-cell responses in mammals. The can be used to produce a vaccine comprising 2 of these sequences attached to a peptidyl core matrix. They are useful in producing T-cell responses to the GT enzyme causing a reduction of colonisation or accumulation of mutans steptococcal strains Synthetic glucosyl-transferase peptide(s) - provoke T- and B-cell reactions in mammals, and are effective against dental caries. Claim 3; Page 24; 38pp; English.

mutans glucosyltransferase (GTF) enzyme. AAW34157 and AAW34158 are from mutans glucosyltransferase (GTF) enzyme. AAW34157 and AAW34158 are from the catalytic domain of GTF, while AAW34160 is from the GTF surface domain. AAW34156 and AAW34159 are from the glucan-binding domain of GTF. These sequences can all be used in the immunoganic composition of the invention. The composition of the invention can alternatively comprise one or more of these sequences linked to a lysine core matrix (see AAW34161-W34165). A composition comprising one of these sequences can be administered to a mammal to raise an immune response, in a method for interfering with the enzymatic activity of streptococcal strains in of the colonisation or accumulation of mutans streptococcal strains in the glucan-binding activity of the streptococcal strains in the glucan-binding activity of the streptococcal glucosyltransferase. The peptides can also be used in vaccines for preventing dental caries in mammals. (Updated on 25-MAR-2003 to correct PF field.) Glucosyltransferase, GTF; enzyme; immunogen; catalytic domain; vaccine; surface domain; glucan-binding domain; mutans streptococcal strain; immune response; glucan-binding activity; dental caries prevention. Immunogenic compositions containing streptococcal glucosyl:transferase peptide(s) - used for provoking immune response to streptococcal glucosyl:transferase for preventing dental caries. Gaps in mammals. The vaccines can be used in preventing dental caries. (Updated on 25-MAR-2003 to correct PN field.) ; 0 Length 14; Indels ; 0 Score 85; DB 2; I Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a glucosyltransferase (GTF) immunogenic epitope, and can be used in the immunogenic composition of the invention. The immunogenic composition (A) comprises at least one streptococcal glucan (SG) and at least one component (I) covalently coupled, (in)directly, to SG. (A) elicits antibodies (Ab) to both SG and (I). (A), and related compositions, are used to induce an antibody response to cariogenic CS bacteria, collectively called "mutans streptococci" (i.e. any of Streptococcus mutans, S. rattus, S. cricetus or S. sobrinus), especially compressive in humans or other animals. The composition can therefore be used for the treatment or prevention of caries (particularly dental caries). Abs raised against (A) can be used: (a) to detect SG, and (b) for passive immunisation, e.g. applied directly to the surface of teeth. SG is a poorly immunogenic type 2 T-cell independent antigen but when coupled to (I) it produces a conjugate which induces significant immunity to both components, resulting in immunological memory and long. lasting antibody production against SG, in adults and children
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunogenic compositions for control of dental caries, based on
Streptococcus mutans components, particularly for vaccination of infants.

```
The present sequence is that of a surface domain peptide fragment of Streptococcus mutans glucosyltransferase. The peptide can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MHC) class II protein-binding peptide from Streptococcus mutants glucan binding protein-B (GDB) covalently linked with a peptide subunit of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multiphtopy collypetides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GDBB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                           Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB-derived peptide of the invention.
                                                                                                                                                                                                                                                                                                                                      New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MfC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Glucosyltransferase; GTF; enzyme; immunogen; catalytic domain; vaccine; surface domain; glucan-binding domain; mutans streptococcal strain;
                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a novel immunogenic composition which comprises a peptide corresponding to a subunit of glucosyltransferase (GTF) enzyme. The immunogenic composition is useful as a GTF subunit vaccine for preventing dental caries. The present sequence is a GTF control peptide, MAC. This sequence is found in Streptococcus sobrinus
                                                                                                                                                                                                                                                                                                                                                              New immunogenic composition comprises a peptide corresponding to a subunit of glucosyltransferase, useful as glucosyltransferase subunit vaccine for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

AAW34161-W34165 represent the Streptomyces mutans glycosyltransferase

(GTF) enzyme immunogenic fragments shown in AAW34156-W34160 linked to a

(GTF) enzyme immunogenic fragments shown in AAW34156-W34160 linked to a

polylypaine core. AAW34157 and AAW34156 are from the catalyvic domain of

GTF, while AAW34160 is from the GTF surface domain. AAW34156 and AAW34159

are from the glucan-binding domain of GTF. These sequences, and the

immunogenic fragments shown in AAW34156 W34160 can all be used in the

immunogenic composition of the invention. A composition comprising one of

these sequences can be administered to a mammal. The immune response

response, in a method for interfering with the enzymatic activity of

streptococcal glucosyltransferase in a mammal. The immune response

results in reduction of the colonisation containing AAW34156

specifically interfere with the glucan-binding activity of the

specifically interfere with the glucan-binding activity of the

streptococcal glucosyltransferase. The peptides can also be used in

vaccines for preventing dental caries in mammals. (Updated on 25-MAR-2003

to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
1. .14
/label= GTF antigenic peptide #5 (see AAW34160)
/note= "attached to the dendritic polylysine core via the alpha-amino group of Lys(15); a second copy of the antigenic 14-mer is linked to Lys(15) via the omega amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "the alpha amino acid group of Lys(16) forms a peptide linkage with the carboxyl amino group of Lys(15); the omega amino group of Lys(16) forms a peptide bond with a second Lys residue analogous to Lys(15)"
                                                                                                                                                                                                                                                                                                                                              /note= "Lys(15) is linked to one copy of the antigenic peptide through the alpha-amino group, and to a second copy of the peptide (not shown) via the omega amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunogenic compositions containing streptococcal glucosyl:transferase peptide(s) - used for provoking immune response to streptococcal glucosyl:transferase for preventing dental caries.

The present sequence is the protein sequence of Streptococcus sobrinus glucosyltransferase-I (GTP-I). Peptide fragments of GTP-I, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions compositions a major histocompatibility complex (MHC) class II protein-binding peptide from S. mutents glucan binding protein-B (GDPB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dieptropic or multiepitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GDBB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                           Glucosyltransferase; enzyme; vaccine; anticaries; epitope; immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunogenicity; immune stimulation; glucan binding protein-B; microparticle; major histocompatibility complex; tooth disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 1590;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a novel dextran saccharase, DSR-E
(ABB98574), from Leuconostoc mesenteroides NRRL B-1299. The saccharase
has glycosyl transferase activity suitable for producing dextrans having
alpha(1-2) branches from sucrose, p-nitrophenyl-alpha-D-glucopyranoside,
alpha-fluoroglucose, alpha-D-glucopyranoside-alpha-D-sorbopyranoside,
calpha-fluoroglucose, alpha-D-glucopyranoside-alpha-D-sorbopyranoside,
calpha-fluoroglucose, alpha-D-glucopyranoside-alpha-D-sorbopyranoside,
calpha-fluoroglucose, alpha-D-glucopyranoside or alpha-D-galactopyranosyl-sucrose. The dextrans and
related compounds having alpha(1-2) bonds, produced using DSR-E, may be
involved in signalling/cellular recognition processes in vivo
(specifically in regulation of microflora in the intestines or on the
skin); and are potentially useful for improving intestinal transit,
increasing assimilation of minerals (e.g. calcium and/or magnesium),
preventing cancer of the colon and combating skin problems such as acne,
dandruff and body odour. The present sequence is a conserved peptide
candence from the catalytic domain of the DSR-E of the invention.

                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The DNA sequence from Streptococcus sobrinus strain 6715 encodes glucosyltransferase-I (and mutants). The DNA was obtd. by treating S. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially
                                                                                                                                                                             The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a blocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus sobrinus GbpB protein of the invention.
                                                                                                                       (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence glucosyl:transferase-I - comprises Streptococcus sobrinus sequence with at least one nucleotide added or deleted.

This sequence represents a glucosyltransferase (GTF) immunogenic epitope, and can be used in the immunogenic composition of the invention. The immunogenic composition (A) comprises at least one streptococcal glucan (SG) and at least one component (I) covalently coupled, (In)directly, to SG. (A) elicits antibodies (Ab) to both SG and (I). (A), and related compositions, are used to induce an antibody response to cariogenic compositions, are used to induce an antibody response to cariogenic compositions, are used to induce an antibody response to cariogenic composition, to reduce numbers of bacteria or to reduce incidence of caries, in humans or other animals. The composition can therefore be used for the treatment or prevention of caries (particularly dental caries). Abs raised against (A) can be used: (a) to detect SG, and (b) for passive immunisation, e.g. applied directly to the surface of teeth. SG is a poorly immunogenic type 2 T-cell independent antigen but when coupled to (I) it produces a conjugate which induces significant immunity to both components, resulting in immunological memory and long-lasting antibody production against SG, in adults and children
                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunogenic compositions for control of dental caries, based on
Streptococcus mutans components, particularly for vaccination of infants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GTF; antigenic epitope; glucosyltransferase; immunogenic epitope; teeth;
digesting with Sau3AI and fractionating on agarose gel. The 3-5 kbp fragment was ligated into pUC1B and E. coli JM109 transformed with it. AGT-1 expressing clone was isolated and sequenced. The clone may be used in the development of a drug for dental caries

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a novel immunogenic composition which comprises a peptide corresponding to a subunit of glucosyltransferase (GTF) enzyme. The immunogenic composition is useful as a GTF subunit vaccine for preventing dental caries. The present sequence is the Streptococcus mutans glucosyltransferase peptide GTF-C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New immunogenic composition comprises a peptide corresponding to a subunit of glucosyltransferase, useful as glucosyltransferase subunit vaccine for preventing dental caries.

The present invention relates to a novel dextran saccharase, DSR-E
(ABB98574), from Leuconostoc mesenteroides NRRL B-1299. The saccharase
has glycosyl transferase activity suitable for producing dextrans having
alpha[1-2) branches from sucrose, p-nitrophenyl-alpha-D-glucopyranoside,
alpha-fluoroglucose, alpha-D-glucopyranoside-alpha-D-sorbopyranoside,
alpha-fluoroglucose, alpha-D-glucopyranoside-alpha-D-sorbopyranoside,
claba-dctopyranosyl-sucrose. The dextran saccharase is useful in
prebiotic, pharmaceutical or cosmetic compositions. The dextrans and
related compounds having alpha(1-2) bonds, produced using DSR-E, may be
involved in signalling/cellular recognition processes in vivo
(specifically in regulation of microfilora in the intestines or on the
skin); and are potentially useful for improving intestinal transit,
increasing assimilation of minerals (e.g. calcium and/or magnesium),
preventing cancer of the colon and combating skin problems such as acne,
dandruff and body odour. The present sequence is a conserved peptide
sequence from the catalytic domain of the DSR-E of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New glycosyl transferase enzymes, containing glucan bonding and catalytic domains and producing alpha-(1-2) branched dextrans, useful in probiotic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GtfB.1/CTB chimeric peptide antigenic for glucosyltransferase B protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

the glucan is produced in the amyloplast and/or vacuole or a maize line deficient in starch biosynthesis, transformed with a gene encoding a glucosyltransferase B or D enzyme, wild-type or mutant and a paper comprising the glucan (paper sizing)/coating agent). The vector is useful for producing a glucan in a plant. The method comprises transforming a plant cell with the vector, growing the plant cell under plant growing conditions to produce a regenerated plant and inducing expression of the polynucleotide for a time sufficient to produce the glucan in the conditions to produce a regenerated plant and inducing expression of the polynucleotide for a time sufficient to produce the glucan in the ribulose biphosphate carboxylase small subunit, waxy, brittle-1 and chlorophyll AB binding protein to produce a transgenic plant, and glucan is produced in the amyloplast of pocato or the vacuole of sugar beet. Glucans are useful as substitutes for and additions to modified starch and latexes in paper manufacture. Unlike prior art techniques, which require input materials that produce chemical effluents, paper manufacture unlike prior art techniques, which require input materials that produce chemical effluents, paper biologically produced input materials is more cost-effective and environmentally friendly. Moreover, glucans also exhibit thermoplastic

Anti-caries agent composed of a monoclonal antibody against an inhibitory enzyme against water insoluble glucan synthetase of glucosyl transferase-B (GTF-B) of Streptococcus mutans. The invention relates to a monoclonal antibody against dental caries and an anti-caries agent composed of a monoclonal antibody produced by Streptococcus mutans, particularly mouse-hybridoma MHP126 (FERM P-17566) or mouse-hybridoma MHP136 (FERM P-17567), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyl transferase-B. The monoclonal antibody specifically inhibits water insoluble glucan synthetase of Streptococcus mutans produced glucosyl Disclosure, Page 22-25; 28pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the protein sequence of Streptococcus mutans glucosyltransferase-C (GTF-C). Peptide fragments of GTF-C, especially from the actalyric domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions binding peptide from S. mutants glucan binding protein-B (GDPB) binding peptide from S. mutants glucan binding protein-B (GDPB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or muticapiropic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GDpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
transferase-B and is used in the immunotherapy of dental caries. This sequence represents a Streptococcus mutans monoclonal antibody-related
                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                         New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MfC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Glucosyltransferase, GTFB, transgenic plant, paper sizing, coating composition, glucan, starch, latex, thermoplastic molecule,

coating composition comprising a glucan produced in a plant transformed with a gene encoding the mutant GTF, wild type or, starch, a latex, thermoplastic molecule or their combinations or glucan and starch where ce the glucan is produced in the amyloplast and/or vacuole or a maize line deficient in starch biosynthesis, transformed with a gene encoding a glucosyltransferase B or D enzyme, wild type or mutant and a paper comprising the glucan (paper sizing/coating agent). The vector is useful for producing a glucan in a plant. The method comprises transforming a plant cell with the vector, growing the plant cell under plant growing conditions to produce a regenerated plant and inducing expression of the polynucleotide for a time sufficient to produce the glucan in the regenerated plant, where the vector contains a transit sequence from riphlose biphosphate carboxylase small subunit, waxy, brittle-1 and chlorophyll AB binding protein to produce a transgenic plant, and glucan cip produced in the amyloplast of potato or the vacuole of sugar beet. Glucans are useful as substitutes for and additions to modified starch and latexes in paper manufacture. Unlike prior art techniques, which require input materials that produced by GTF, which utilises consultations and impart gloss to the paper during coating step. The present correction input materials to the paper during coating step. The present sequence is not shown in the specification but was created by the indexer cusing the GTEB sequence appearing as AAUSB027 and the information in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

Glucosyltransferase B or D protein useful for producing a glucan useful as substitutes for and additions to modified starch and latexes in paper manufacture, comprises mutations in specific positions.

Claim 36; Page; 44pp; English.

The invention an isolated protein comprising a glucosyltransferase (GTF)

Explypeptide having changes at position from 1448V, D457N, D567T,

Extlaff, D457N/D567T, D457N/D571K, D567T/D571K/K1014T,

Extlaff, D457N/D567T/D571K/T7304/K104T, X169A/K170A/K171A, and K773Q or a

CG GTF D polypeptide having changes at positions from T589D, T589E, M471D,

CG GTF mitant, an isolated polymuclecide which encodes plor P2, or its

CG GTF mutant, an expression cassette comprising the polymuclecide, a ribonucleic acid sequence encoding the

CG GTF mutant, an expression cassette comprising the polymuclecide per produced with the vector, a transgenic plant, a paper sixing and/or

CGTF mutant, as each or tuber from the transgenic plant, a paper sixing and/or

CGTF mutant, as ased or tuber from the transgenic plant, a paper sixing and/or

CGTF mutant, an expression cassette comprising the polymuclectide per produced with the vector, a transgenic plant, a paper sixing and/or vector, a seed or tuber from the transgenic plant, a latex,

CC coating composition comprising a glucan produced in a plant transformed

WHIT a gene encoding the mutant GTF, wild type or, starch, a latex,

CC coating composition comprising a glucan produced in a plant transformed

WHIT a gene encoding the mutant GTF, wild type or mutant and a paper

CC coating the glucan (paper sixing/coating agent). The vector is useful

CE for producing a glucan in a plant. The method comprises transforming a

CC for producing a glucan in a plant. The method comprises transforming a

CC for producing a glucan in a plant the vector contains a transit sequence from

CC for producing to produce a regenerated plant and inducing expression of the

CC regenerated plant, where the vector contains a transit sequence from

CC regenerated plant, where the vector contains a transit sequence

CC polymucleotide for a time sufficient to produce a transgenic plant, and place manufacture. Unlike prior art techniques, which

CC dilores are useful as substitutes for and additions to modified a

complementary polymucleotide, a ribonucleic acid sequence encoding the complementary polymucleotide, a ribonucleic acid sequence encoding the polymucleotide operably linked to a promocer, a vector comprising the polymucleotide host call introduced with the vector a transgenic plant comprising the vector, a seed or tuber from the transgenic plant, a paper sizing and/or vector, a seed or tuber from the transgenic plant, a paper sizing and/or vector, a seed or tuber from the transgenic plant, a paper sizing and/or vector is a seed or tuber sizing and or vector, starch, a latex, with a gene encoding the mutant GTF, wild type or, starch, a latex, the glucan is produced in the amyloplast and/or vacuole or a maize line deficient in starch biosynthesis, transformed with a gene encoding a glucap plant comprising the glucan (paper sizing/coating agent). The vector is useful for producing a glucan in a plant. The method comprises transforming a glucan in a plant. The method comprises transforming a plucan in a plant. The method comprises transforming a plucan in a plant, and inducing expression of the conditions to produce a regenerated plant and inducing expression of the polymucleotide for a time sufficient to produce the glucan in the vector contains a transit sequence from ribulose biphosphate carboxylase small subunit, waxy, brittle-1 and conditions biphosphate carboxylase small subunit, waxy, brittle-1 and contains are useful as substitutes for and additions to modified starch and latexes in paper manufacture. Unlike prior art techniques, which require input materials that produce definical efficients and impart gloss to the paper of the invention. Note: The present sequence represents a GTFB mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer claim 36 claim 36
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Complementary polynucleotide, a ribonucleic acid sequence encoding the CGTF mutant, an expression cassette comprising the polynucleotide operably linked to a promoter, a vector comprising the expression cassette, host cell introduced with the vector, a transgenic plant comprising the vector, a seed or tuber from the transgenic plant, a paper sizing and/or coating composition comprising a glucan produced in a plant transformed with a gene encoding the mutant GTF, wild type or, starch, a latex, thermoplastic molecule or their combinations or glucan and starch where the glucan is produced in the amyloplast and/or vacuole or a maize line deficient in starch biosynthesis, transformed with a gene encoding a clucosyltransferase B or D enzyme, wild-type or mutant and a paper comprising the glucan (paper sizing) coating agent). The vector is useful for producing a glucan in a plant. The method comprises transforming a comprising the glucan in a plant. The method comprises transforming a conditions to produce a regenerated plant and inducing expression of the polynucleotide for a time sufficient to produce the glucan in the conditions to produce a regenerated plant and inducing expression of the polynucleotide for a time sufficient to produce the glucan in the cribulose biphosphate carboxylase small subunit, waxy, brittle-1 and collorophyll AB binding protein to produce a transgenic plant, and alatexes in paper manifactures for and additions to modified starch and latexes in paper manifacture. Glucans are useful as substitutes for and additions to modified starch carboxylase small subunit, waxy, brittle-1 and collocally produced input materials, is more cost-effective and environmentally friendly. Moreover, glucans also exhibit thermoplastic composition in the specification but was created by the indexer sequence represents a GTPB mutant of the invention. Note: The present cusing the GTPB sequence appearing as AAU98027 and the information in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention an isolated protein comprising a glucosyltransferase (GTF) Bolypoptide having changes at position from 148V, D457N, D567T, K1014T, D457N/D567T, D457N/D571K, D567T/D571K/K1014T, D457N/D567T/D571K/K1014T, 1448V/D457N/D567T/D571K/K1014T, 1448V/D457N/D567T/D571K/K1014T, 1448V/D457N/D567T/D571K/K1014T, 1469A/Y170A/Y171A, and K779Q or a GTF D polypeptide having changes at positions from T589D, T589B, N471D, W471D/T589D, and N471D/T589E. Also included are a glucan produced by the GTF mutant, an isolated polymucleotide which encodes P1 or P2, or its complementary polynucleotide, a ribonucleic acid sequence encoding the
                                                                                                                                                                                                                                                                                               Glucosyltransferase B or D protein useful for producing a glucan useful as substitutes for and additions to modified starch and latexes in paper manufacture, comprises mutations in specific positions.

```

Glucosyltransferase B or D protein useful for producing a glucan useful as substitutes for and additions to modified starch and latexes in paper manufacture, comprises mutations in specific positions.

WPI; 2002-414332/44.

(NICH/) NICHOLS S E.

Nichols SE

Claim 36; Page; 44pp; English.

The invention an isolated protein comprising a glucosyltransferase (GTF)

E polypeptide having changes at position from 1448V, D457N, D567T,

E K1014T, D457N/D571K/R779Q/K1014T, X169A/Y170A/Y171A, and K779Q or a

CK1014T, D457N/D567T/D571K/K779Q/K1014T, X169A/Y170A/Y171A, and K779Q or a

GTF D polypeptide having changes at positions from T589D, T589E, N471D,

CM191D/T589D, and N471D/T589E. Also included are a glucan produced by the

CM191D/T589D, and N471D/T589E. Also included are a glucan produced by the

CM191D/T589D, and N471D/T589E. Also included are a glucan produced by the

CM191D/T589D, and N471D/T589E. Also included are a glucan produced by the

CM191D/T589D, and N471D/T589E. Also included are a glucan produced by the

CM191D/T589D, and N471D/T589E. Also included are a glucan produced by the

CM1000 of the mutant, an expression cassette comprising the polymucleotide operably

Linked to a promoter a vector comprising the polymucleotide operably

Linked to a promoter a vector comprising the expression cassette, host

CM1000 cating composition comprising a glucan produced in a plant transformed

CM1000 cating composition comprising a glucan produced in a plant transformed

CM1000 cating composition comprising a glucan produced in a gene encoding a

Glucosyltransferase B or D enzyme, wild-type or mutant and a paper

CM2 comprising the glucan (paper sizing/coating agent). The vector is useful

CM2 plant cell with the vector, growing the plant cell under plant growing

CM2 conditions to produce a regenerated plant and inducing expression of the

CM2 plant cell with the vector growing the plant cell under plant growing

CM3 plant cell with the vector growing the plant cell under plant growing

CM3 plant cell with a myloplase small subunit, waxy, brittle-1 and

CM3 produced in the amyloplase contains a transgenic plant, and

CM3 produced in the amyloplast of potent or orditions to modified sugarch

CM3 plant engell as substitutes for and additions to modified sugarch

CM3 plant engelle and plant for a marker pl

manufacture utilising the glucan produced by GTF, which utilises biologically produced input materials, is more cost-effective and environmentally friendly. Moreover, glucans also exhibit thermoplastic properties and impart gloss to the paper during coating step. The present sequence represents a GTFB mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the GTFB sequence appearing as AAU98027 and the information in

```
COMPLIANT, an isolated polynucleotide which encodes P1 or P2, or its complementary polynucleotide, a ribonucleic acid sequence encoding the CTF mutant, an expression cassette comprising the publynucleotide operably confirmation. The comprising the expression cassette, host call introduced with the vector, a transgenic plant, a paper sizing and/or coating composition comprising a glucan produced in a plant transformed with a gene encoding the mutant GTP, wild type or, starch, a latex, the glucan is produced in the amyloplast and/or vacuole or a maize line deficient in starch blosynthesis, transformed with a gene encoding a glucosyltransferase B or D enzyme, wild-type or mutant and a paper of producing a glucosyltransferase B or D enzyme, wild-type or mutant and a paper comprising the glucan (paper sizing/coating agent). The vector is useful for producing a glucan in a plant. The method comprises transforming a comprising the glucan (paper sizing/coating agent). The vector is useful for producing to produce a regenerated plant and inducing expression of the comprision to produce a regenerated plant and inducing expression of the plant cell with the vector, growing the plant cell under plant growing conditions to produce a regenerated plant and inducing expression of the regenerated plant, where the vector contains a transit sequence from its produced in the amyloplast of potduce a transgenic plant, and glucan in the subjoducing protein to produce a transgenic plant, and glucan is produced in the amyloplast of potduce a transgenic plant, and glucan substitutes for and additions to modification to modification to produce the glucan produced by GTF, which utilises considerate input materials that produce chemical effluents, paper manufacture utilising the glucan produce deficitor and impart gloss to the paper during coating step. The present sequence is not shown in the specification but was created by the indexer claim 36 claim 36 claim 36 claim 36 claim 36 claim 36 claim 36 claim 36 claim 36 claim 36 claim 36 clai
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Moreover, glucans also exhibit thermoplastic properties and impart gloss to the paper during coating step. The present sequence represents a GTFB mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the GTFB sequence as PAU98027 and the information in
                                                                                                                                                                                                                                                                                                                        Glucosyltransferase B or D protein useful for producing a glucan useful as substitutes for and additions to modified starch and latexes in paper manufacture, comprises mutations in specific positions.

The invention an isolated protein comprising a glucosyltransferase (GTF)

E polypeptide having changes at position from 1448V D657N, D557T,

K1014T, D657N/D57TK/K779G/K104T, T169A/Y170A/Y171A, and K779G or a

1448V/D45TK/D567TY/D57TK/K174G/K1014T, T169A/Y170A/Y171A, and K779G or a

GTF D polypeptide having changes at positions from T589D, T589E, M41D,

M471D/T589D, and M471D/T589E. Also included are a glucan produced by the complementary polynucleotide, a ribonucleic acid sequence encoding the complementary polynucleotide, a ribonucleic acid sequence encoding the complementary polynucleotide, a ribonucleic acid sequence encoding the complementary polynucleotide, a ribonucleic acid sequence encoding the complementary polynucleotide, a ribonucleic acid sequence encoding the comprising the expression cassette, host confirmed with the vector comprising the expression cassette, host cocting composition comprising a glucan produced in a plant transformed vith a gene encoding the mutant GTF, wild type or, starch where the glucan is produced in the amyloplast and/or vector. a maize line deficient in starch biosynthesis, transformed with a gene encoding a glucan in the amyloplast and/or vector is maize line deficient in starch biosynthesis, transformed with a gene encoding a glucan in a plant. The method comprises transforming a glucan in a plant. The method comprises transforming computions to produce a regenerated plant and inducing expression of the polyuncleotide for a time sufficient to produce the glucan in the anticonduce of the subject of produce a regenerated plant and inducing expression of the colyuncleotide for a time sufficient to produce a transgenic plant, and glucan ribulose biphosphate carboxylase small submit, waxy, brittle-1 and conduced in the amyloplast of potato or the vacuol of sugar back collucans are useful as substitutes for and additions to modified starch and latexes in paper manufacture. Unlike prior art techniques, which environmentally friendly moreover, glucans also exhibit thermoplastic

thermoplastic molecule or their combinations or glucan and starch where the glucan is produced in the amyloplast and/or vacuole or a maize line ac deficient in starch biosynthesis, transformed with a gene encoding a glucosyltransferase B or D enzyme, wild-type or mutant and a paper comprising the glucan (paper sizing/coating agent). The vector is useful cfor producing a glucan in a plant. The method comprises transforming a plant cell with the vector, growing the plant cell under plant growing conditions to produce a regenerated plant and inducing expression of the polynucleotide for a time sufficient to produce the glucan in the ribulose biphosphate carboxylase small subunit, waxy, brittle-1 and ribulose biphosphate carboxylase small subunit, waxy, brittle-1 and chlorophyll AB binding protein to produce a transgenic plant, and glucan cis produced in the amyloplast of potato or the vacuole of sugar beet. Glucans are useful as substitutes for and additions to modified starch and latexes in paper manufacture. Unlike prior art techniques, which crequire input materials that produce chemical effluents, paper constitution and impart gloss to the paper during costing step. The present properties and impart gloss to the paper during costing step. The present sequence is not shown in the specification but was created by the indexer cusing the GTFB sequence appearing as AAU98027 and the information in

Streptococcus mutans glucosyltransferase-B.

WO2003075845-A2

29-JAN-2004 (first entry)

```
Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                 Glucosyltransferase, enzyme, vaccine, anticaries, epitope, immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 16; Page 12-13; 49pp; English.

GTF D41DA/P561Ge having changes at positions from T58DE, N477D,

N471D/T569D, and N471D/T569E. Also included are a glucan produced by the complementary polynucleotide, a ribonucleic act a glucan produced by the GTF mutant, an expression cassette comprising the expression cassette. Host complementary polynucleotide, a ribonucleic acid sequence encoding the complementary polynucleotide, a ribonucleic acid sequence encoding the vector, a reade of r tuber from the transgenic plant, a paper sizing and/or centro, a seed or tuber from the transgenic plant, a paper sizing and/or centro aced or tuber from the transgenic plant, a paper sizing and/or vector, a seed or tuber combinations or glucan produced in a maize line conting composition comprising a glucan produced in the amyloplast and/or vector, a seach blosynthesis, transfermed with a gene encoding a glucan in a plant. The method comprises transformed in a plant coll with the vector, growing the plant and inducing expression of the glucosyltransferase B or D enzyme, wild-type or mutant and a paper comprising the glucan (paper sizing/coating agent). The vector is useful as glucan in the polymphase carboxylase small submit, waxy, brittle-1.a.

Compliant in produced in the mayloplast of polymucleotide for a time sufficient to produce a transgenic plant, and glucan chorophyll AB binding protein to produce a transgenic plant, and glucan are useful as substitutes for and additions to modified starch chorophyll right meterial and subcan produced by GFF, which utilises in paper manufacture. Unlike prior care devicition and impart gloss to the paper during coating sete, The progreement of the importing a sequence 
                                                                                                                                                                                                                             Glucosyltransferase B or D protein useful for producing a glucan useful as substitutes for and additions to modified starch and latexes in paper manufacture, comprises mutations in specific positions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 67; DB 5; Length 1475;

The present sequence is the protein sequence of Streptococcus mutans glucosyltransferase-B (GTF-B). Peptide fragments of GTF-B, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions compositions and subunit vaccines for dental caries. These compositions binding speptide from S. mutants glucan binding protein-B (GDB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Diepitopic or multiepitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Anti-caries agent composed of a monoclonal antibody against an inhibitory enzyme against water insoluble glucan synthetase of glucosyl transferase-B (GTF-B) of Streptococcus mutans.
                                                                                                                                                                                New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                      The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antibody, dental caries, water insoluble glucan synthetase, anti-caries, glucosyl transferase-B; immunotherapy.

                                                      The invention relates to a monoclonal antibody against dental caries and an anti-caries agent composed of a monoclonal antibody produced by Streptococcus muthans, particularly mouse-hybridoma MH9126 (FERM P-1756) or mouse-hybridoma MH9136 (FERM P-1756), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyl transferase-B. The monoclonal antibody specifically inhibits water insoluble glucan synthetase of Streptococcus mutans produced glucosyl transferase-B and is used in the immunotherapy of dental caries. This sequence represents a Streptococcus mutans monoclonal antibody-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a novel immunogenic composition which comprises a peptide corresponding to a subunit of glucosyltransferase (GTF) enzyme. The immunogenic composition is useful as a GTF subunit vaccine for preventing dental caries. The present sequence is the Streptococcus mutans GTF-B control peptide, MAC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New immunogenic composition comprises a peptide corresponding to a subunit of glucosyltransferase, useful as glucosyltransferase subunit vaccine for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Method for preparing mutant gene by using, as mutagen, radiation selected from UVA(ultra violet a), UVB(ultra violet b), UVC(ultra violet c), x-ray, VUV(vacuum ultra violet) and ultrasoft x-ray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        radiation is provided, to mutate a specific gene selectively by direct radiation. Therefore, it can be useful for improving genes of industrial enzymes and developing enzymes having novel properties. The present sequence represents a dextransucrase mutant DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for preparing a mutant gene by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a novel dextran saccharase, DSR-E
(ABB98574), from Leuconostoc mesenteroides NRRL B-1299. The saccharase
has glycosyl transferase activity suitable for producing dextrans having
alpha11-2) branches from sucrose, p-nitrophenyl-alpha-D-glucopyranoside,
alpha-fluoroglucose, alpha-D-glucopyranoside alpha-D-galactopyranoside or
calpha-fluoroglucose, alpha-D-glucopyranoside alpha-D-galactopyranoside or
prebiotic, pharmaceutical or cosmetic compositions. The dextrans and
related compounds having alpha(1-2) bonds, produced using DSR-E, may be
involved in signalling/cellular recognition processes in vivo
(specifically in regulation of microflora in the intestines or on the
skin); and are potentially useful for improving intestinal transit,
increasing assimilation of minerals (e.g. calcium and/or magnesium),
preventing cancer of the colon and combating skin problems such as acne,
dandruff and body odour. The present sequence is a conserved peptide
sequence from the catalytic domain of the DSR-E of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New glycosyl transferase enzymes, containing glucan bonding and catalytic domains and producing alpha-(1-2) branched dextrans, useful in probiotic,
                                                                                                                                                                                                                                                                                                       Dextran saccharase; enzyme; cytostatic; dermatological; antiseborrheic; DSR-E; glycosyl transferase; dextran; prebiotic; pharmaceutical; microflora regulation; intestinal transit; mineral assimilation; colon cancer; acne; dandruff; body odour.
                                                                                                                                                                                                                                                                       Dextrane-saccharase, DSR-E, catalytic domain conserved peptide dsrB #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                           8
                                                                                                                                                                                                                                                                                                                    ö
                                                                                    Method for preparing mutant gene by using, as mutagen, radiation selected from UVA(ultra violet a), UVB(ultra violet b), UVC(ultra violet c), x-ray, VUV(vacuum ultra violet) and ultrasoft x-ray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a mutant gene of dextransucrase, a recombinant vector comprising the same gene, a microorganism transformed with the same vector, and dextransucrase produced therefrom are provided, thereby improving the production yield of dextran having a high ratio of branched bond which is useful in medicines, foods and cosmetics. The present sequence represents the mutant dextransucrase.
                                                                                                                                                                    The invention relates to a method for preparing a mutant gene by radiation is provided, to mutate a specific gene selectively by direct radiation. Therefore, it can be useful for improving genes of industrial enzymes and developing enzymes having novel properties. The present sequence represents a dextransucrase mutant DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mutant gene of dextransucrase, recombinant vector comprising the same gene, microorganism transformed with the same vector, and dextransucrase produced therefrom.
                                                                                                                                                                                                                                                                                                                   Gaps

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
cucleic acids into a host cell and culturing the cell to express the
cyclin. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
concers and cancer metastesses of haematopoietic antigen genomic
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK87950 and AAM82169
represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense; prokaryotic essential gene; cell proliferation; drug design.

polymorlecoides. The invention also relates to antibodies against the polympetides, methods for producing the polympetides, a method of generating vaccines for immunising an individual against P. mirabilis, a method for evaluating a compound for the ability to bind a P. mirabilis, a polympetide and a method for screening test compounds for anti-bacterial activity. The polympetides and polymorlecitides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial angular pathological conditions for antibacterial diseases as components of antibacterial vaccines, as targets sequence represents a Proteus mirabilis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Proteus mirabilis polypeptides and polynucleotides, useful as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway in which a proliferation, or that inhibite scallular proliferation; (8) identifying a gene required for callular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, s activity; (11) a culture comprising strains in which the gene product is overexpressed; (12) determining the extent or which the strains is antibiotic or all partion of an organism acts; (9) manufacturing a mathibiotic; (10) profiling a compound, such a strains is an independent in a collaboration or the propertice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense mucleic acids are useful for identifying proteins or screening for homologous mucleic acids required for cellular proliferation to isolate candidate molecules for rational

The invention also relates to antibodies against the polypeptides, methods for producing the polypeptides, method of producing the polypeptides, method for evaluating a compound for the ability to bind a P. mirabilis a method for evaluating a compound for the ability to bind a P. mirabilis polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polynucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial drugs or as bio-control agents for plants. This sequence represents a Proteus mirabilis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Proteus mirabilis polypeptides and polynucleotides, useful as reagents for diagnosis of bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for 'Plants'.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the invention retailers to an isolater in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense acid; (2) a host cell containing the vector; (3) an isolated nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for the activity of compound that influences the activity of required for pathway; in which a proliferation or that inhibits callular proliferation; (8) can gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the gene or underexpressed or underexpressed; (12) determining the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the gene or organism. The antisense nucleic acids are useful for strains; or (13) identifying the targer of a compound that inhibits the compound compounds activity; (11) a culture comprisense nucleic acids are useful for proliferation of an organism. The antisense nucleic acids required for required for proliferation in cells other than S. aureus, S. typhimurium, companised for proliferation in cells other than S. aureus, S. typhimurium, companism or the target prokaryotic essential genes. Note: The sequence data for this companied for proliferation of the particle of the particle of organism and proper sequence is encoded by one of the target prokaryotic sesential genes. Note: The sequence data for this compa

The invention relates to polynucleotides (AAK51456-AAK51435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymentedes and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                      Nucleic acids encoding polypeptides with cytokine-like activities, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  epidermidis; open reading frame; ORF; bacterial infection; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                 glucosyltransferase activity of a lattic acid bacterium on a sucrose substrate. The method is useful as a thickener, as a prebiotic and as a bioactive agent and as an anti-corrosion agent. The glucan can be incorporated in foodsruffs such as beverages, sauces, dressings, dairy products. The glucan is useful as anticorrosion agent, e.g. for the protection of ship hulls. It can also be incorporated in nutritional or pharmaceutical compositions intended for improving the condition of the gastrointestinal tract. The present sequence represents a sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation.

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections.
                                                                                  Disclosure; SEQ ID NO 2980; 267pp; English
